AI-LAB

AI-LAB · USER GUIDE

User Playbook

Turn an idea into working software with a team of AI agents — without touching the terminal.

Start in three steps

1 **Open the app**
Go to the address your operator gave you. Locally it is **http://127.0.0.1:8080**.

2 **Finish the checklist**
The dashboard walks you through: provider, API key, lab, Tech Lead, GitHub and project. Each step opens the right form.

3 **Send your first idea**
Type what you want in **New idea** and press **Send**. The Tech Lead turns it into cards on the board.

No login. The app is for one operator on your machine. Your API keys stay encrypted and are never shown again.

The five screens you need

Screen	What it is for
Dashboard	See what is happening now and what to do next.
Board	Move work through TODO, READY, DOING, REVIEW, DONE. ICEBOX parks work with a reason.
Lab	Watch the team in the pixel office. Click an agent to see its card, CV and controls.
Memory	Search what the team has learned. Pin the notes you want to keep.
Settings	Set the budget, autonomy, team, scheduler and office preferences.

Everyday actions

I want to...	Go to
Add an idea	Dashboard → New idea
See a card	Board → click the card
Move work	Board → drag the card
Check an agent	Lab → click the agent
Find knowledge	Memory → search
Change money or policy	Settings → Budget or Autonomy

Card refused? The card snaps back and a toast explains why. Read the reason; do not force the move.

When something is blocked

Blocked is information, not a dead end. A red badge or a card in ICEBOX means a reason was recorded. Open the card and read **Why is this blocked**.

What you see	What to do
The card will not move	Read the toast. The first missing rule is named there.
An agent is paused	Lab → agent → Controls → Resume, or Settings → Team.
A budget stop	Settings → Budget. Raise it only with the operator.
A provider is down	Dashboard → System health. Wait, or ask the operator to check the key.
A card is in ICEBOX	Open it, read the blocked reason, and resolve it before moving it back.

Good to know

Keys are write-only.
You see only the last four characters. Never paste a key into a card or a note.

Every move is logged.
The card history shows who changed what, when and why.

One operator.
The local app has no login. Do not expose it to the network without the operator.

The office is truthful.
Agents animate only what the backend says they are doing.

Need help? Open the card or the agent inspector, copy the trace id from the error, and send it to the operator.

That is the whole product: an idea, a board, a team, and a memory. Keep the board moving and the office will show you the truth.
